---

This technology strategy assessment on sodium batteries, released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) 2030 strategic initiative. In this post, we'll break down the top 5 battery technologies used in BESS and help you understand their advantages, limitations, and typical applications. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to. made of molten sodium (Na). The electrodes are separated by a solid ceramic, sodium beta alumina, which also serves as the electrolyte. The battery temperature is kept between 300° C and 360° C to keep the electrodes in a. A sodium-sulfur (NaS) battery is a high-capacity, high-temperature energy storage system that stores energy using molten sodium and sulfur as active materials. NaS batteries use molten. art card and var .
