Power flow analysis, as one of the fundamental tools for microgrid analysis, its mathematical essence involves solving a set of multivariate nonlinear equations through iterative computations to determine parameters such as voltage, phase angle, and power at various nodes (or. In response to the complexity of the Jacobian matrix inversion process in the power flow algorithm for AC/DC microgrids, leading to large memory requirements and susceptibility to convergence issues, a novel power flow algorithm based on an improved unified iteration method for AC/DC microgrids is. A microgrid (MG) is a unique area of a power distribution network that combines distributed generators (conventional as well as renewable power sources) and energy storage systems. Due to the integration of renewable generation sources, microgrids have become more unpredictable. MGs can operate in. In this paper, an AC/DC optimal power flow method for hybrid microgrids and several key performance indicators (KPIs) for its techno-economic assessment are presented. Power flow calculation is not only a tool for operation state analysis of AC/DC hybrid microgrid, but also the basis for control mode and operation mode. In order to utilize the advantage of AC and DC network, an efficient and flexible hybrid power network can be configured and operated by connecting them together through an AC/DC converters.
