

# Direct drive wind power generation wind measurement system

## Overview

---

This paper proposes a set of simplified models of the direct-drive permanent magnet synchronous wind power generation system (D-PMSG) and classifies them according to the timescale of the dynamics and the use cases, i., faults (transient stability analysis), system contingencies. The resulting findings underscore the efficacy and viability of the proposed generator for wind turbine applications, affirming its potential to enhance wind energy conversion systems. In addition, it is highlighted like mechanical structure, thermal behaviour and electromagnetic structure. For a different research purpose in a different timescale, a different. With ZEISS metrology solutions, it is possible to perform measurement and inspection on small and big dimensional components on the highest level of accuracy.
