

Distributed Generation and Solar Energy

Overview

Distributed generation (DG) refers to electricity generation done by small-scale energy systems installed near the energy consumer. These systems are called distributed energy resources (DERs) and commonly include solar panels, small wind turbines, fuel cells and energy storage. Distributed generation, also distributed energy, on-site generation (OSG), [1] or district/decentralized energy, is electrical generation and storage performed by a variety of small, grid -connected or distribution system-connected devices referred to as distributed energy resources (DER). Picture a home with solar panels on the roof and a battery mounted on an exterior wall, storing energy from the solar panels during the day for use at night. This 'solar+storage' system is an increasingly common sight across the country, with up to 25% of new solar installations including attached.

Environmental Impacts of Distributed Generation
Distributed generation refers to a variety of technologies that generate electricity at or near where it will be used, such as solar panels and combined heat and power. Distributed generation may serve a single structure, such as a home or business, or it may be part of a microgrid (a smaller grid that is also tied into the larger electricity deliv See more on epa.gov
