

# Distributed solar is divided into inverter type

## Overview

---

Broadly, they can be classified into grid-tied inverters, off-grid inverters, and hybrid inverters. Grid-tied inverters are designed to synchronize with the utility grid, allowing excess power to be fed back, while off-grid inverters operate independently, often in remote areas. There are a variety of implementation schemes for inverters, which are mainly divided into two categories: voltage type and current type. The design capacity of solar photovoltaic power generation system can range from a few kilowatts to hundreds of kilowatts, or even megawatts. The diversity in types of solar inverter is vast, ranging from simple string inverters to complex hybrid systems, each designed to meet specific operational requirements.
