

Energy storage is what photovoltaics were 5 years ago

Overview

In 1954, scientists at Bell Labs produced the first practical silicon solar cell. Solar continues to be one of the fastest-growing sources of electricity generation in the U. In just the last five years, solar has evolved to become even more accessible to businesses that are looking to reduce their overhead costs as well as their carbon footprint. However, it wasn't until the mid-20th century that significant strides were made in harnessing the power of the sun for practical purposes. The first solar cells, developed in 1941, had an efficiency of less than 1%. Energy storage systems, on the other hand, store excess energy for later use, addressing the intermittent nature of renewable energy sources like solar power. It will take a lot more legislation, policy, production, and tech development to see this alternative form of energy become a main form of energy.
