Overview

Whether the panels are installed by a professional solar contractor or by a division within your company, basic safety measures may include: installing equipment that complies with product-specific safety standards (such as rapid shut-off for inverters), having the. Whether the panels are installed by a professional solar contractor or by a division within your company, basic safety measures may include: installing equipment that complies with product-specific safety standards (such as rapid shut-off for inverters), having the. This Tech Talk discusses the fire hazards associated with PV systems installed on industrial and commercial buildings. Photovoltaic (PV) panels can be retrofitted on buildings after construction or can be used to replace conventional building materials used for roofs, walls or facades. Fire safety. DC (direct current) produced by PV panels is converted to AC (alternating current) using inverters, for local use or to be sent to power grids. In addition to this, many systems will include a battery energy storage system (BESS) that provides storage of power for use when the sun is not shining. That's why the Solar Energy Technologies Office (SETO) funded the Solar Training and Education for Professionals (STEP) program, which provides tools to more than 10,000 firefighters and fire code officials to manage solar equipment as they put out fires. Learn more about the STEP funding program. PV systems are extremely safe under normal operating conditions if installed and maintained by professionals according to electrical regulations and. According to the International Energy Agency Photovoltaic Power Systems Program (IEA PVPS), "PV systems do not pose health, safety or environmental risks under normal operating conditions if properly installed and maintained by trained personnel as required by electric codes.
