Overview

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy to electrical energy. Electroactive elements are "elements in solution that can take part in an electrode reaction or that can be adsorbed on the electrode." Electrolyte is stored externally, general. Overview

A flow battery, or redox flow battery (after), is a type of where is provided by two chemical components in liquids that are pumped through the system. The (Zn-Br₂) was the original flow battery. John Doyle file patent on September 29, 1879. Zn-Br₂ batteries have relatively high specific energy, and were demonstrated in electric car. Redox flow batteries, and to a lesser extent hybrid flow batteries, have the advantages of:

- Independent scaling of energy (tanks) and power (stack), which allows for a cost/weight.

What Are Flow Batteries and How Do They Work?Future Applications For Flow BatteriesFlow Batteries vs. Lithium Ion BatteriesIndustry Outlook For Flow BatteriesThe main difference between flow batteries and other rechargeable battery

types is that the aqueous electrolyte solution usually found in other batteries is not stored in the cells around the positive electrode and negative electrode. Instead, the active materials are stored in exterior tanks and pumped toward a flow cell membrane and power stack. See more on solarreviews Author: Dan HahnMIT Energy Initiative
