

Flywheel energy storage should be combined with chemical energy storage

Overview

FESS can be used in conjunction with medium and long duration mechanical/thermal/chemical storages to mitigate slow ramp up times of the latter and accelerate storage response. The existing energy storage systems use various technologies, including hydro-electricity, batteries, supercapacitors, thermal storage, energy storage flywheels,[2] and others. Pumped hydro has the largest deployment so far, but it is limited by geographical locations. This system ensures high energy output and efficient recovery.
