High temperature fuel cell energy storage

Overview

SOFC (Solid Oxide Fuel Cell), SOEC (Solid Oxide Electrolysis Cell), and r-SOC (Reversible Solid Oxide Cell) represent high-temperature, ceramic-based electrochemical technologies. Expertise in fuel cell technologies requires mastery of both theory and practical skills only attainable by operating hardware. What is a fuel cell?

A heat engine (Just say 'No' to Carnot! When do you use a fuel cell?

reduction reaction using electrons to do work. This is NOT Combustion! !!! !!!. Effective thermal management is crucial for optimizing the performance, efficiency, and durability of fuel-cell technologies, including proton-exchange membrane fuel cells (PEMFCs) and solid-oxide fuel cells (SOFCs). They enable efficient, flexible, and green energy conversion: SOFC converts fuel to electricity/heat, SOEC produces. to 950oC 2H2+O2- O2 + 4e- 2O2- Fuel Utilization Factor (Uf) = 60 Air Utilization Factor = 30% 2H2+2CO3 2- → 2H2O + 2CO2 + 4e- Configuration 1 □ reformer after the air preheater, Configuration 2 □ reformer after the water preheater, Configuration 3 □ reformer after the natural gas preheater. This chapter is devoted to address the latter topic and provides an overview of high-temperature fuel cells for efficient and environmentally “clean” power generation from fossil fuels with capture-ready production of CO 2 without the need for post-separation from flue streams.
