

How solar computers generate electricity

Overview

These cells directly convert sunlight into electricity through a process known as the photovoltaic effect. When sunlight hits these cells, it excites electrons, creating an electric current. This current can then be captured and used to power various devices, including computers. But how exactly do they work, and what makes them tick?

At their core, solar generators harness energy from the sun. However, it must have one critical feature that many cheaper, basic models lack.
