

Hydrogen-cooled generator inlet air temperature requirements

Overview

Cooling systems are designed to provide adequate cooling for full load operation at a specified ambient air temperature typically between 40C° (104F°) and 50C° (122F°). We have a hydrogen cooler for a large electric generator, which requires 2000 GPM of cooling water at 85F. Evaluating cooler performance with new coolant properties and new coolant temperatures, I need to know the Hydrogen inlet/outlet temperatures. There are times where NFPA recommendations are more cautious. NFPA 2 is a continuously evolving code for hydrogen facilities. Explosion Protection (reserved) 10. GH2 Vehicle Fueling Facilities 11.
