

Is photovoltaic panel power generation reliable and safe

Overview

The generation of electricity from photovoltaic (PV) solar panels is safe and effective. Because PV systems do not burn fossil fuels they do not produce the toxic air or greenhouse gas emissions associated with conventional fossil fuel fired generation technologies. DOE solar reliability and safety research and development (R&D) focuses on testing photovoltaic (PV) modules, inverters, and systems for long-term performance, and helping investors, consumers, and companies predict long-term performance. PV reliability research is a priority for many in the solar. Solar energy can be harnessed two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat water for domestic uses, to warm buildings, or heat fluids to drive electricity-generating turbines. It is essential to recognize that, like any energy solution, solar energy presents its own set of risks and challenges, including health. Overall, solar panels are a highly reliable technology that provides clean, renewable energy for many years.
