

Low Carbon Energy Storage System Activities

Overview

Long Duration Energy Storage (LDES) technologies are categorized into five distinct types: flow batteries, compressed air energy storage, liquefied air energy storage, thermal energy storage, and gravity energy storage. As outlined in the 2021 LDES Net-zero power report,¹ long-duration energy storage (LDES) offers a low-cost flexibility solution to enable energy system decarbonization. About 50% of all heat produced is used for industrial processes - 20% (6 gigatonnes) of global CO₂ emissions. With today's technology TES could displace the equivalent of around 8% of current global gas use (2% of. Energy storage is pivotal for transitioning to a low-carbon economy as it enhances grid reliability, supports renewable energy integration, and reduces greenhouse gas emissions, contributing to sustainable practices that mitigate climate change.
