

# Low altitude exhaust of the generator room flue

## Overview

---

Because of a long equivalent length of the exhaust flue (about 40-50 FT and bends), the calculated pressure loss exceeds that suggested for the generator. One solution is to increase the size of the flue by making it rectangular and long on one side instead of circular to. To investigate code requirements for generator exhaust it is important to start by reviewing the International Mechanical Code® (IMC). The installation of liquid-fueled. Longer pipe runs and numerous changes in direction, all leading to excessive exhaust system backpressure —which can cause engine damage. Works Tip: Consider the silencer size and exhaust system routing early in project planning. Without proper ventilation, this heat can damage internal components, reduce the system's lifespan, and create safety hazards.
