

# Lower the wind temperature for waste heat power generation

## Overview

---

Lower-temperature waste heat can be recovered from thermal systems and processes and converted to electricity using other technologies, such as the organic Rankine cycle coupled with turbines or reciprocating engines. This WHP configuration is also referred to as “bottoming. Waste heat to power (WHP) is the process of capturing heat discarded by an existing thermal process and using that heat to generate power (see Figure 1). Energy-intensive processes—such as those occurring at refineries, steel mills, glass furnaces, and cement kilns—all release hot exhaust gases and. Most of the waste heat from industrial processes (more than 60% = 10–20 PWh globally) is rejected to the environment as low grade heat below 100°C.
