

New mainstream energy storage battery prices stabilize

Overview

Prices are falling faster than expected, grid-scale storage has already blown past its 2025 deployment target, and new mega-projects announced today—from the U.S. to Angola and Uzbekistan—show how rapidly batteries are reshaping the world's electric grids. Overall, the downward price effect during discharge outweighs the small upward effect during charging. Analysis of EPEX day-ahead data clearly shows that when charging during. According to the latest Energy Storage Monitor report released today, in the third quarter of 2024, the United States deployed a total of 3,806 megawatts (MW) and 9,931 megawatt-hours (MWh) of energy storage, a new Q3 record and an 80% and 58% increase over the same span in 2023. The bumper year will be followed by a compound annual growth rate of 14.
