

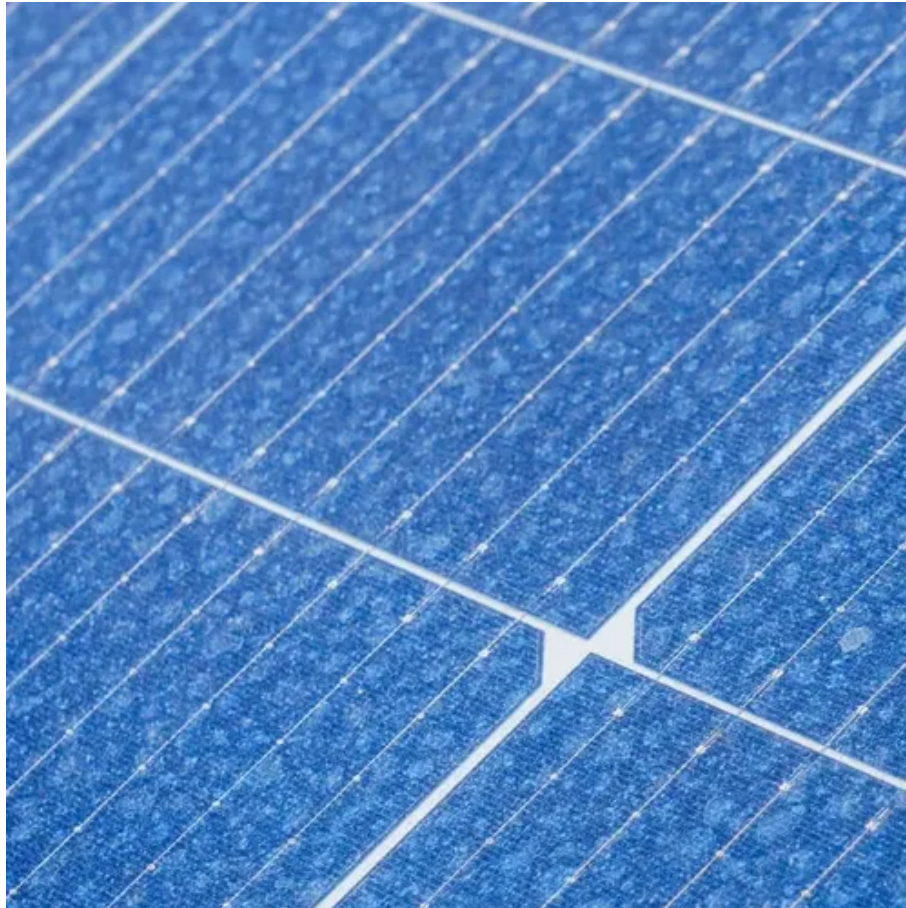

Photovoltaic panel user self-investment mode

Overview

Solar self-consumption allows households and businesses to directly use the energy generated by their solar panels, reducing dependence on the grid. Battery storage can increase self-consumption rates from 30% to 80%: While residential systems without storage typically achieve 25-40% self-consumption, adding battery storage can boost this to 60-90%, dramatically improving payback periods from 6-8 years to 4-5 years. Load shifting is the most. For solar adopters seeking the greatest return on their investment in energy capture and storage technology, self-consumption is the way to go. This can happen in two ways: producing and using immediately (solar panels send electricity directly to your home appliances) or producing and storing. Self-consumption of photovoltaic (PV) renewable energy is the economic model in which the building uses PV electricity for its own electrical needs, thus acting as both producer and consumer, or prosumer.
