

Reasons for low photovoltaic panel temperature

Overview

As temperatures rise, the efficiency of solar panels tends to decline. This drop in performance is attributed to the fundamental physics of semiconductor materials; as temperature increases, the voltage output of the solar cells decreases, leading to a reduction in overall power. Temperature Coefficient is Critical for Hot Climates: Solar panels with temperature coefficients of $-0.30\%/^{\circ}\text{C}$ or better (like SunPower Maxeon 3 at $-0.27\%/^{\circ}\text{C}$) can significantly outperform standard panels in consistently hot climates, potentially saving thousands in lost energy production over the. Extreme temperatures can actually lower solar panel efficiency and reduce the amount of electricity it generates. We'll take a look at how heat impacts solar panels, the science behind them, and at what point you might see a real difference in their output. 5% for every degree Celsius increase above optimal operating temperatures ($25^{\circ}\text{C}/77^{\circ}\text{F}$).
