

# Solar inter-seasonal heat storage tank

## Overview

---

The seasonal heat storage technology stores the surplus solar energy in spring, summer, and autumn and releases it for large-scale regional centralized heating and hot water supply in winter. The thermal energy can be collected whenever it is available and be used whenever needed, such as in the opposing season. It is proposed that the summer heat can be injected into the ground. The global energy transition requires efficient seasonal energy storage systems (SESSs) to manage fluctuations in renewable energy supply and demand. STES works by collecting “sustainable heat”, often produced by solar thermal panels, or “waste heat”, which is generally recovered from an industrial process and which would be lost under normal.
