

# Solar power generation current is unstable

## Overview

---

Owing to the intermittent nature of solar energy and the unpredictability in its production caused by elements like weather and time of day, the grid may become unstable due to changes in frequency and voltage. Solar energy has become a significant actor in the fight to lessen the consequences of climate change as the globe moves towards sustainable energy sources. Weather, seasonal, and daily fluctuations could affect grid functionality and. In our series of debunking some sustainability myths, today we will tackle the myth that renewable energy is unreliable because of intermittency. If not properly managed, system dynamics can lead to stability problems and potential costly blackouts. Numerous variables, including the time of day and the weather, contribute to this unpredictability. The system may become unstable due to the erratic energy supply, which might independent of load demand or control of the grid operator.
