Overview

A solar collector is fundamentally a device engineered to absorb radiant energy from the sun and convert it into a usable form. In concentrating solar-thermal power (CSP) plants, collectors reflect and concentrate sunlight and redirect it to a receiver, where it is converted to heat and then used to generate electricity. The main purpose of. While photovoltaic systems use chemical reactions to generate direct current, collectors gather heat from the Sun's rays. This collected heat is then used for various applications such as heating water, air, or other fluids in solar water heaters, solar cookers, and industrial systems.
