

Supercapacitors vs conventional capacitor

Overview

Unlike ordinary capacitors, supercapacitors do not use a conventional solid dielectric, but rather, they use electrostatic double-layer capacitance and electrochemical pseudocapacitance, [2] both of which contribute to the total energy storage of the capacitor. They are passive components, meaning they do not generate energy but rather store and release it. In fact, many people don't know the difference. That's why we've created this guide. It typically stores 10 to 100 times more.
