

The standard value of the base station power supply voltage is 0

Overview

The common base station power supply system is powered by a 48 V DC bus, which is connected to the DC load and backup battery [12, 13]. As a result, a variety of state-of-the-art power supplies are required to power 5G base station components. Modern FPGAs and processors are built using advanced nanometer processes because they often perform calculations at fast speeds using low voltages (<0. □ The radius of coverage area of 5G high-frequency base stations will be less than one-tenth of that of 4G base stations, and the coverage area of 5G. The present document can be downloaded from the ETSI Search & Browse Standards application. The present document may be made available in electronic versions and/or in print. +27V) and the bus voltage for. The 5G transmission is moving toward millimeter wave (mmWave) spectrum spanning up to 71 GHz to achieve the speeds that differentiates it from 4G. A push-pull converter is used to convert the 48V input voltage to +/-12V and to provide electrical isolation.
