

Thermal Management Analysis of Energy Storage Containers

Overview

This study investigates the thermal behavior of lithium-ion batteries within containerized energy storage system, focusing on optimizing airflow distribution and temperature uniformity using computational fluid dynamics (CFD). Key findings, methodologies, and innovations. This study addresses the optimization of heat dissipation performance in energy storage battery cabinets by employing a combined liquid-cooled plate and tube heat exchange method for battery pack cooling, thereby enhancing operational safety and efficiency. The packed bed represents a loosely packed solid material (rocks).
