Overview

As the wind turns the blades of the turbine, the mechanical energy generated drives an electric generator. Solar power plants convert sunlight directly into electricity using photovoltaic (PV) cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different. At its core, a solar generator converts sunlight into electrical energy through a combination of solar panels, batteries, and power inverters. Larger solar cells are grouped in PV panels, and PV panels are connected in.
