

What is a lithium battery

Our Lifepo4 batteries can be connected in parallels and in series for larger capacity and voltage.

Overview

A lithium-ion battery or Li-ion battery is a type of rechargeable battery that uses the reversible intercalation of Li ions into electronically conducting solids to store energy. Compared to other types of rechargeable batteries, they generally have higher specific energy, energy density, and energy efficiency and a longer cycle life and calendar life. In the three decades after Li-ion batteries. Specific energy 1–270 W·h/kg (3.6–972.0 kJ/kg) Energy density 250–693 W·h/L (900–2,490 J/cm³) Specific power 1–10,000 W/kg Charge/discharge efficiency 80–90% History One of the earliest examples of research into lithium-ion batteries is a CuF₂/Li battery developed by in 1965. The breakthrough that produced the earliest form of the modern Li-ion battery was made by British c. Generally, the negative electrode of a conventional lithium-ion cell is made from . The positive electrode is typically a metal or phosphate. The is a in an . The negative el. Lithium-ion batteries may have multiple levels of structure. Small batteries consist of a single battery cell. Larger batteries connect cells into a module and connect modules and parallel into a pack. Multi.
