

# What is the trench under the photovoltaic panel

## Overview

---

Trenching is the process of digging a narrow channel in the ground to house the electrical conduits that connect your solar panels to your home's electrical system. This crucial step enables the safe and efficient routing of power generated by your solar. This page covers the layout and digging of the trench for the underground wiring from the meter/distribution panel location on the house to PV panel array out in the yard. The PV system we decided on uses Enphase micro-inverters mounted at each PV panel to convert the DC generated by the PV panel. Depending on the situation, solar EPCs have a few installation options, including direct burial, conduit, and hangers. When solar developers directly bury PV wires, they install them in trenches underneath the panel rows. I could go with 6" of trench depth and metal conduit, I could go with 18" of trench depth and PVC, or I could go with 24" of depth and underground feeder.

Is there any code that will allow the use of conduit in a shallower trench? This will be up to 600v DC. The code will require you to use either steel conduit or concrete encased conduit if you ...

### Beneath the Panels

But beneath the panels runs a nervous system of carefully designed civil infrastructure--trenches and ducts that enable the entire site to breathe, pulse, and connect.

### [Is trenching always required for underground electrical service](#)

As for what it is, it means digging a trench from the MSP to the transformer, and replacing the wires in the ground. If it's direct bury cable or cable in small conduit that's the only way to ...
